

Comments:

The above is the burndown representation of our group's work over the duration of this sprint. The first thing to note is that for some reason, Trello was saying that there were 24 points remaining, when in fact, there were only 8 points left in our Sprint Backlog section. Therefore, the November 4th points remaining should be 8 and there should be a big drop from 24 points to 8 points on the final day of the sprint.

That aside, as we can see, there was not much progress made in the first half of the sprint and then some gradual progress occurred with a final push at the end to complete things. The reason for this was primarily due to the Assignment 1 that was due October 28th. Prior to this date, a lot of time was being spent on that assignment and that explains why the points were completed after this date passed.

Velocity Comparison:

The Average Daily Burndown of this sprint was 1.79 points compared to our last sprint of 3.14 points. A large reason for this is the fact that Trello isn't detecting that we only have 8 points left as opposed to 24 so this number is incorrectly skewed. An extra 16 points completed (if Trello was working for us the way we want it to) would likely have put our average daily burndown closer to the same level it was in Sprint 2. Also, the velocity is higher for the last sprint considering that we intentionally gave ourselves a bit of a lighter sprint in terms of points, due to the fact that this sprint fell right in a busy period of midterms for many of us. These two factors are what contributed to the lowered velocity of this sprint.
